**CS 362 -004 -U2017**

**Extra Credit : Url Random Tester**

To generate my random tester, I randomly selecting url partitions from Result Pair into creating the Url for testing. Here is the steps

i) Created Result Pair Array with different url partitions for Scheme, Authority, Port, Path and Query
ii) Create a random number from the length of each Result Pair array.
iii) Combining the partitions to create a url
iv) Testing the url using isValid

I am running the random tests for 1000 counts.

The results are printed to urlRamndomResults.txt
